PROFILE

Third-year computer engineering student at TVZ who has been delivering React and TypeScript web applications since 2021. Earlier this year I worked as the sole active QA engineer on a mobile application at Porsche eBike Performance, in an international team and a release process where every build is verified before it reaches users. That is why testing, defect reproduction and code review are habits rather than things I still need to learn. Looking for a development role in a team where someone more experienced reviews my code. Written reference available from the ASW team lead at Porsche eBike Performance.

EXPERIENCE

Junior QA Engineer | Porsche eBike Performance GmbH

Feb – May 2026

German engineering organisation, international team, English as the working language. Role ended with the site closure.

- **Sole active QA resource** for the mobile application: owned test planning, execution and reporting across **iOS and Android**.
- Wrote **Appium automation** for regression flows, so repeatable checks stopped depending on someone walking through the app by hand.
- Tested **gRPC and HTTP endpoints** directly against the application contract, not only through the interface.
- Reproduced, isolated and documented defects across app, API and backend boundaries, in a form developers could act on.
- Worked inside a release process where broken builds are caught before production, which is the standard I now hold my own code to.

Full-Stack Developer (freelance) | Self-employed

2021 – Present

- **Stolarija BM**: sole designer and developer on a catalogue and web shop, plus the admin interface staff use daily for inventory, orders and customer messages. Next.js, TypeScript, Supabase.
- Deliver client applications end to end: scoping, build, testing, deployment and maintenance in production. React, TypeScript, Node.js, PostgreSQL.
- Work in a **Git branch workflow** with pull requests, and set up **GitHub Actions CI/CD** so projects deploy on merge rather than by hand.

Co-founder / Developer | Vectra XR

Dec 2025 – Present

Own product in development, three-person team.

- Led the frontend architecture: Turborepo monorepo, Next.js App Router in **TypeScript**, Prisma with **PostgreSQL**, REST and JSON APIs, authentication through Clerk (OAuth/OIDC).
- Wrote a **Python service** (Flask) for 3D file conversion, with SHA-keyed caching on object storage and defined behaviour when a conversion fails.
- Ran **code review** and the release process for two other engineers, and wrote the internal specifications they built against.

PROJECTS

- **Stocks Royale**: Node and Express backend generating simulated prices, stored in PostgreSQL and streamed over Socket.io into a Next.js frontend. The main problem was choosing a repaint cadence that keeps the numbers current without blocking the browser.
- **Pentix** (pentix.eu): counts push-up reps from the phone camera using MediaPipe PoseLandmarker over WASM, wrapped in a live scoring engine.
- **Vector**: dashboard with an assistant built on the Anthropic SDK. **LiftLog**: native Android app in Kotlin (MVVM, Room). **Runtime**: API monitoring dashboard built at a hackathon. Write-ups at antoniobrkic.com.

SKILLS

Languages: TypeScript, JavaScript, Python, Kotlin, SQL

Web: React, Next.js (App Router), Node.js, Express, Flask, Prisma, PostgreSQL, MySQL, REST and JSON APIs, gRPC, Socket.io

Testing: Appium, manual and automated mobile testing on iOS and Android, endpoint testing, defect isolation and reporting

Tools & process: Git and GitHub (branches, pull requests, code review), GitHub Actions CI/CD, Figma, Vercel, Supabase, Cloudflare R2, Claude Code and Cursor

EDUCATION

BSc Computer Engineering (in progress), Tehničko veleučilište u Zagrebu (TVZ), third year. Coursework: databases, algorithms, deep learning (PyTorch), Android development. Croatian native speaker, advanced English (working language at Porsche eBike Performance).
